

Standout Feature	Your Project	NotebookLM
Multi-format Document Processing	Supports full pipeline for PDFs, PPTX, DOCX, and handwriting OCR with table extraction and structured chunking to preserve page numbers, slide titles, etc.	Limited support, mostly typed notes and PDFs without advanced OCR or table extraction
Hybrid Retrieval Architecture	Combines semantic vector search + BM25 keyword search with reranking and contextual compression, tuned confidence thresholds, and parent document retrieval	Primarily semantic retrieval over user documents
Web Augmentation with Confidence Gating	Automatically triggers web search (SerpAPI/Tavily) for low-confidence queries, integrates credible academic sources dynamically during query answering	No external web augmentation; answers only based on uploaded corpus
Advanced Prompt Engineering & Multi-Mode Answering	Custom prompt templates for detailed explanations, quick summaries, stepwise solutions, refusal policies, and structured JSON outputs with confidence scores	Limited ability to choose answer modes and prompt customization for structured outputs

Agentic Capabilities & Lifecycle Automation	Planned agents for query decomposition, verification (cross-checking responses), quiz generation, and document summarization to automate tutoring workflows	Static, no agentic workflows; single-step Q&A only
Caching & Performance Optimization	Semantic + exact caching layers to reduce response latency and API cost, fine-tuned thresholding, cache invalidation strategies	No exposed caching or performance tuning controls
Session Management with Full Conversation History	Stores and manages multi-session user chat histories, searchable past Q&A, auto-generated session titles, session export, usage dashboards	Basic session persistence without advanced multi-session or search features
Robust Evaluation & Monitoring	Implemented evaluation pipeline with retrieval precision, faithfulness scoring, regression tests, and user feedback loops feeding back into system improvement	No exposed evaluation framework or automated feedback incorporation
Security, Rate Limiting, Access Control	User-level vector DB isolation, JWT auth, rate limiting with Redis, input validation, content safety filters for PII/toxicity, encryption at rest	Limited or no visible enterprise-grade security and governance features
Deployment & Scalability Design	Dockerized microservices for backend, frontend, Redis, VectorDB; production-ready	Primarily closed, managed environment without open

	CI/CD; horizontal scaling architecture planned	deployment architecture
